

imageWARE Enterprise Management Console Version 4

Manage MEAP Applications on the Device Fleet

The Device Application Management (DAM) feature for imageWARE Enterprise Management Console lets you remotely install, update, and uninstall MEAP applications on network connected devices.

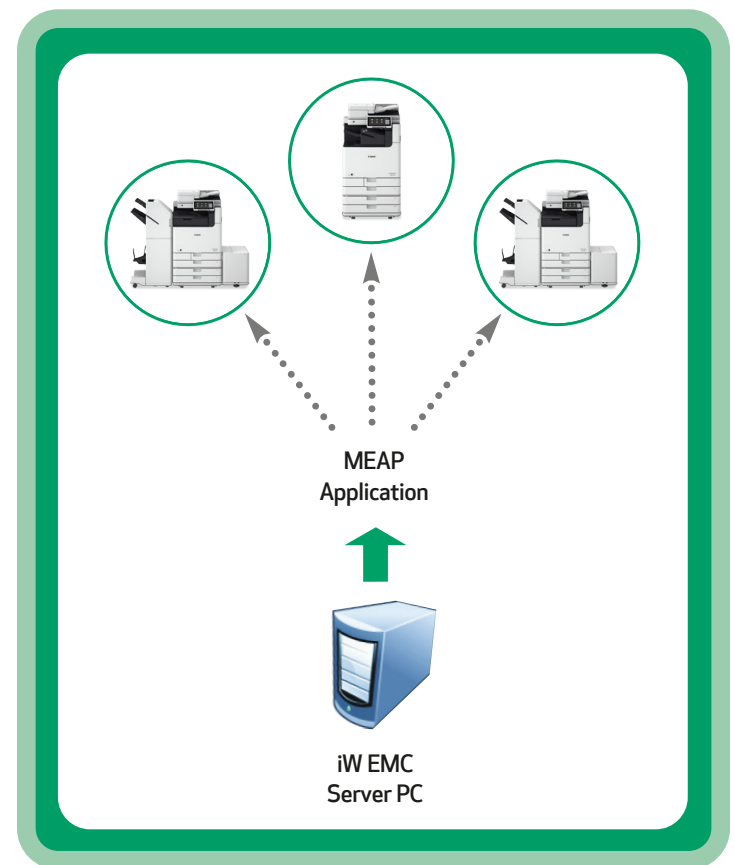

Advantages of DAM:

- **Centralize application management** with one single interface and install/uninstall applications for a batch of devices. You can also update licenses from this feature when the license for an application installed in your devices has expired.
- **Allows you to control applications remotely.** You can start or stop applications installed within your devices from this feature.
- **You can gather device application inventory and information.** Check the applications installed in your devices as well as related application information. The details can also be exported to a file as necessary.
- **User can enable task-based management.** This feature enables you to install and uninstall applications using tasks. A task is a specified set of operations that are automatically executed at the desired time and date.

SYSTEM REQUIREMENTS

The Device Application Management feature must be used with imageWARE Enterprise Management Console and conforms to the same system requirements.

Device Application Management Feature Workflow
