

imageWARE Enterprise Management Console Version 4

Developed to Further Improve Efficient Fleet Management

The Device Firmware Update (DFU) feature for imageWARE Enterprise Management Console helps address the need for firmware management, version management, and batch distribution of firmware. The firmware for a fleet of imageRUNNER ADVANCE devices can easily and conveniently be updated at a scheduled time. The DFU feature can be used without Local-Content Delivery System (L-CDS) to manage firmware versions that can be effortlessly retrieved from devices to ensure consistent versions across the fleet.

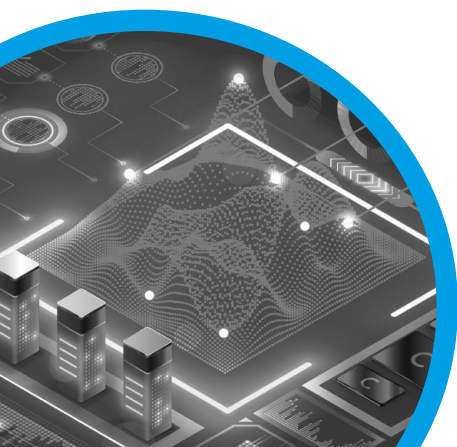

Advantages of DFU:

- **Batch-update the firmware** on imageRUNNER ADVANCE models from the intranet. By linking with L-CDS, the firmware of multiple devices can be easily updated at the same time using a single imageWARE Enterprise Management Console task.

- **Provide a single management point** for device firmware versions. The DFU feature can retrieve the firmware versions of imageRUNNER ADVANCE and legacy devices, which can be managed by the DFU feature and also exported to a file as needed.
- **Quickly change the Content Delivery System Connection** setting on multiple devices using a single task.
- **Provide the capability of managing all imageRUNNER ADVANCE firmware** in one convenient place, allowing for consistent firmware versions across all devices.

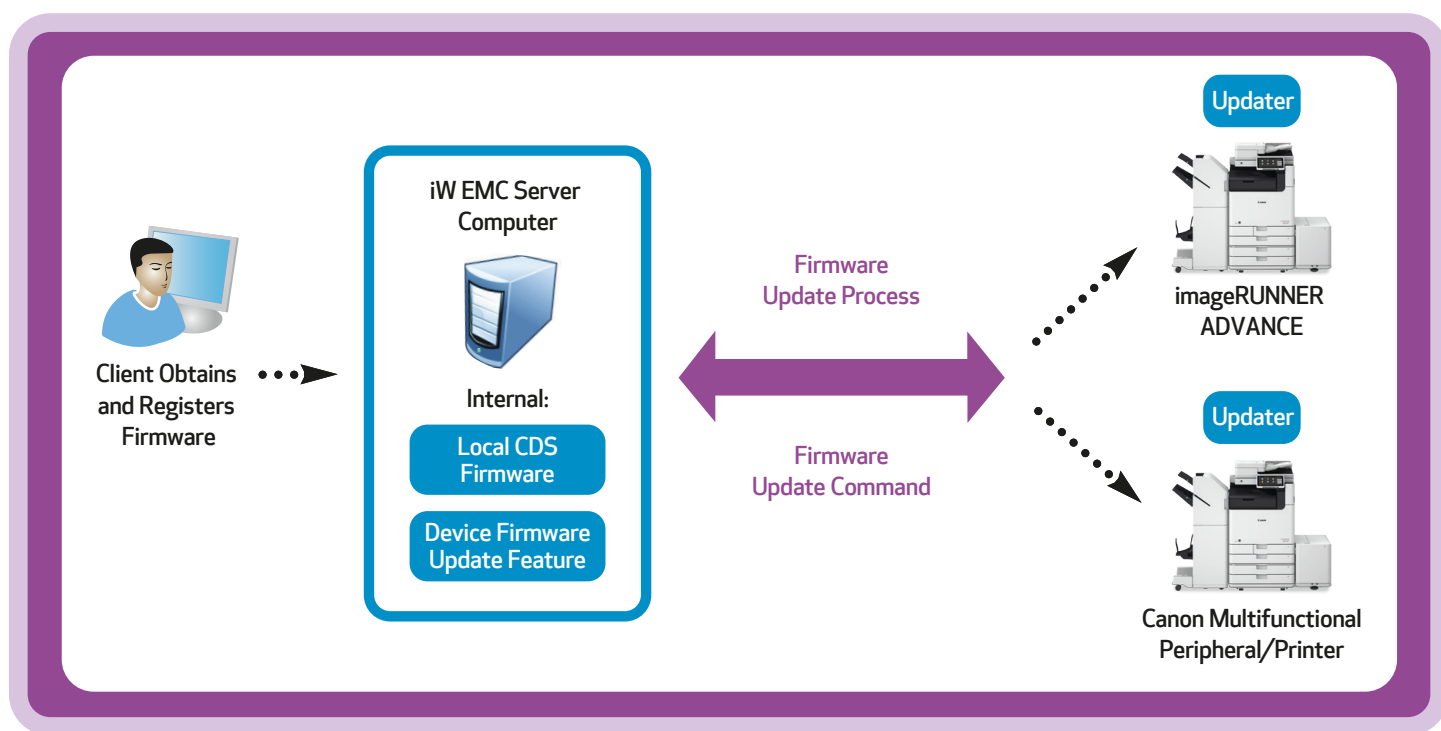

SYSTEM REQUIREMENTS

The Device Firmware Update feature must be used with imageWARE Enterprise Management Console and conform to the same system requirements.

Device Firmware Update Feature Workflow
